

5 **Amendments in the Claims:** (struck-through parts deleted and underlined parts added)

1. (currently amended) A tissue box holding device comprising:
a panel, said panel having a rear edge, a forward edge and a pair of lateral side
edges;
a pair of legs, each of said legs having a lower end being attached to and
10 extending upwardly from said rear edge, said legs being spaced from each
other such that each of said legs is positioned adjacent to one of said side
edges, each of said legs being positioned in a plane orientated substantially
perpendicular to a plane of said panel;
a brace being attached to and extending between said legs;
15 a bracket being attached to said legs and extending over said panel such that a
plane of said bracket is orientated substantially parallel to said ~~plain~~ plane
of said panel;
a coupler being attached to an upper end of said legs for selectively coupling said
legs to a vertical surface; and
20 wherein a tissue holding box may be removably positioned on said panel and held
against said legs by said bracket.
2. (original) The device according to claim 1, wherein said panel has a width
from said rear edge to said forward edge generally between 1 inch and 2 inches.
25
3. (original) The device according to claim 2, wherein said panel has a length
between said side edges generally between 4 inches and 5 inches.
4. (original) The device according to claim 2, wherein said panel has a length
30 between said side edges generally between 9 inches and 10 inches.
5. (original) The device according to claim 2, wherein each of said legs has a
height generally between 4 inches and 5 inches.

5 6. (original) The device according to claim 2, wherein said bracket includes
an elongated member and a pair of arms being attached to and extending away from
opposite ends of said elongated member, said arms being orientated perpendicular to said
elongated member, each of said arms having a free end with respect to said elongated
member, each of said free ends being attached to one of said legs.

10

7. The device according to claim 6, wherein each of said legs has an outer
edge with respect to each other, each of said free ends being positioned adjacent to a
respective one of said outer edges of said legs.

15

8. (original) The device according to claim 6, wherein said elongated
member has a length substantially equal to said length of said panel.

20

9. (original) The device according to claim 6, wherein said coupler includes a
pair of hooks, each of said hooks being attached to one of said legs, each of said hooks
extending in a direction opposite of said bracket.

25

10. (original) The device according to claim 9, wherein each of said hooks
includes a horizontal portion attached to said legs and a downwardly extending vertical
portion spaced from said legs.

30

11. (original) The device according to claim 10, further including a support
being attached to and extending between said vertical portions of said hooks.

35

12. (currently amended) The device according to claim 11, wherein said
support has at least two apertures extending therethrough, each of said apertures having
an axis orientated perpendicular to said plane of said legs, said apertures being spaced
from said hooks.

Claims 13 and 14 (cancelled)

40

- 5 15. (currently amended) A tissue box holding device comprising:
- a panel, said panel having a rear edge, a forward edge and a pair of lateral side
 edges, said panel having a width from said rear edge to said forward edge
 generally between 1 inch and 2 inches, said panel having a length between
 said side edges generally between 4 inches and 10 inches;
- 10 a pair of legs, each of said legs having a lower end being attached to and
 extending upwardly from said rear edge, said legs being spaced from each
 other such that each of said legs is positioned adjacent to one of said side
 edges, each of said legs being positioned in a plane orientated substantially
 perpendicular to a plane of said panel, each of said legs having a height
15 generally between 4 inches and 5 inches, each of said legs having an outer
 edge with respect to each other;
- a bracket being attached to said legs and extending over said panel such that a
 plane of said bracket is orientated substantially parallel to said ~~plain~~ plane
 of said panel, said bracket including an elongated member and a pair of
20 arms being attached to and extending away from opposite ends of said
 elongated member, said arms being orientated perpendicular to said
 elongated member, each of said arms having a free end with respect to
 said elongated member, each of said free ends being attached to one of
 said legs, each of said free ends being positioned adjacent to a respective
25 one of said outer edges of said legs, said elongated member having a
 length substantially equal to said length of said panel;
- a coupler being attached to an upper end of said legs for selectively coupling said
 legs to a vertical surface, ~~said coupler including a pair of hooks, each of~~
 ~~said hooks being attached to one of said legs, each of said hooks extending~~
30 ~~in a direction opposite of said bracket, each of said hooks including a~~
 ~~horizontal portion attached to said legs and a downwardly extending~~
 ~~vertical portion spaced from said legs, a support being attached to and~~
 ~~extending between said vertical portions of said hooks, said support~~
 ~~having at least two apertures extending therethrough, each of said~~

5 ~~apertures having an axis orientated perpendicular to said plane of said~~
 ~~legs;~~
 a brace being attached to and extending between said legs; and
 wherein a tissue holding box may be removably positioned on said panel and held
 against said legs by said bracket.

10

16. (new) The tissue box holding device according to claim 15, wherein said
coupler comprises a pair of screws, each of said legs having a hole extending
therethrough, each of said screws being removably extendable through one of said holes
and into the vertical surface.

15

17. (new) The tissue box holding device according to claim 15, wherein said
coupler including a pair of hooks, each of said hooks being attached to one of said legs,
each of said hooks extending in a direction opposite of said bracket, each of said hooks
including a horizontal portion attached to said legs and a downwardly extending vertical
20 portion spaced from said legs, a support being attached to and extending between said
vertical portions of said hooks, said support having at least two apertures extending
therethrough, each of said apertures having an axis orientated perpendicular to said plane
of said legs, each of said apertures being spaced from said legs.

25

18. (new) A method of holding a tissue box comprising the steps of:
providing a panel having a rear edge, a forward edge and a pair of lateral side
edges;

30

providing a pair of legs, each of said legs having a lower end being attached to
and extending upwardly from said rear edge, said legs being spaced from
each other such that each of said legs is positioned adjacent to one of said
side edges, each of said legs being positioned in a plane orientated
substantially perpendicular to a plane of said panel, each of said legs
having an outer edge with respect to each other;

35

providing a bracket being attached to said legs and extending over said panel such
that a plane of said bracket is orientated substantially parallel to said plane

5 of said panel, said bracket including an elongated member and a pair of
arms being attached to and extending away from opposite ends of said
elongated member, said arms being orientated perpendicular to said
elongated member, each of said arms having a free end with respect to
10 said elongated member, each of said free ends being attached to one of
said legs, each of said free ends being positioned adjacent to a respective
one of said outer edges of said legs, said elongated member having a
length substantially equal to said length of said panel;
providing a coupler being attached to an upper end of said legs for selectively
coupling said legs to a vertical surface;
15 providing a brace being attached to and extending between said legs;
positioning a tissue box on said panel such that said brace extends around said
tissue box; and
attaching said upper ends of said legs to a vertical surface with said coupler.

20 19. (new) The method according to claim 18, wherein said coupler includes a
pair of hooks, each of said hooks being attached to one of said legs, each of said hooks
extending in a direction opposite of said bracket, each of said hooks including a
horizontal portion attached to said legs and a downwardly extending vertical portion
spaced from said hooks.

25 20. (new) The method according to claim 19, wherein said coupler further
includes a support being attached to and extending between said vertical portions of said
hooks, said support having at least two apertures extending therethrough, each of said
apertures having an axis orientated perpendicular to said plane of said legs, each of a pair
30 of screws being extended through one of said apertures in said support and into said
vertical surface.

21. (new) The method according to claim 18, wherein said coupler includes a
pair of screws, each of said screws being selectively extended through one of a pair of
35 holes in said legs such that said legs are attached to the vertical surface.
